

1. Understanding AI and Generative AI

a. Description -

1. Define AI and Generative AI with examples. Explain the applications of AI in the education sector.

Artificial Intelligence (AI) refers to computer systems that can perform tasks that can normally require human intelligence. Examples include problem- solving, language understanding, like chatbots

Generative AI learns pattern from training data and generate new content in response to prompts.

For Example- Generative AI can generate a lesson plan from a prompt.

Artificial Intelligence (AI)

- **Core idea-** Computers performing tasks that require human intelligence
- **Main goal-** To solve hard problems and learn from data
- **How it works-** It uses rules and data to spot patterns
- **Common uses-** Checking your spelling or finding a driving route.

Generative AI

- **Core idea- Computers creating original content**
- **To make new things like art, stories or code**
- **It learns patterns from existing data and generates new content on based on those patterns.**
- **Writing essays, drawing pictures from text prompts, or making music**

Personalised Tutoring- AI systems analyse a student's pace and skill level to adjust math or language exercises in real time, offering extra help where needed

Assistive Communication- Text to speech and speech to text tools translate lectures instantly, helping students with visual or audio impairments.

2. AI and Education

Analyse the implications of the use of Artificial Intelligence in the education sector.

Ans- Positive Impacts- AI can support personalised learning, lesson planning, assessment and content creation. AI systems can also adapt lesson to match individual student's speed and skill levels.

Speech to text and real time translation tools help students with diverse learning needs.

Major Challenges

Data privacy risks: Schools collect large amounts of student data that could be vulnerable to breaches.

Cheating concerns: Generative AI makes it easy for students to bypass original writing and critical thinking.

Lack of human touch: Over- reliance on machines can reduce vital social interactions between teachers and students

3.

Use any generative AI tool for an educational purpose, such as lesson planning, assessment design, research support, content creation, or learning assistance.

Reflect on your experience — did you observe any bias, hallucinations, or incorrect information in its responses?

If not, what steps did you take to confirm the accuracy and fairness of the output?

Why is it important for educators and learners to evaluate AI responses critically in educational contexts?

Tool Used- Chat GPT

Purpose- Creating a lesson plan

Ans- I use chat GPT as a Generative AI tool for educational purpose As I teach in preschool, I use it for generate a lesson plan, circular, event report from a prompts. In my prompts a provide clear instructions, regarding the topic, grade, time limit, heading, word limit and the type of images required.

I found that the responses were generally accurate and suitable for my students. I carefully reviewed the generated content and used spell-checking and Grammarly to identify correct spelling and grammar errors. I also checked the information and adapted the content according to the age and learning level of the children.

It is important for educators and learners to evaluate AI responses critically, because AI can sometimes provide incorrect information, unsuitable content or spelling and grammar errors. so that children receive accurate, age appropriate and fair information.

Step to Verify AI in Early Education

- Cross- Check Standards- Compare the AI lesson goals with official early childhood education frameworks.
- Test the Pacing – Break down 10- minute tasks into smaller chunks suitable for toddlers.

- Scan for Bias- Ensure characters names and images in suggested stories represent diverse and neutral viewpoints
- Consult Experts – Review hands-on activity ideas with experienced kindergarten teachers before using them
