Topic 1 – Understanding AI and Generative AI

Artificial Intelligence (AI) can be understood as the ability of computer systems to perform tasks that normally require human intelligence, such as recognising patterns, understanding language, solving problems, and supporting decision-making. From a teacher's perspective, AI acts as a valuable assistant that helps analyse students' learning progress, identify areas where they need additional support, and recommend suitable learning strategies. It enables teachers to make informed decisions and provide more personalised instruction based on individual student needs.

Generative Artificial Intelligence (Generative AI) is a specialised form of AI that not only analyses information but also creates new content such as lesson plans, quizzes, worksheets, reading passages, presentations, and feedback based on prompts provided by the user. In education, AI is used in adaptive learning platforms that personalise learning according to students' abilities and in automated assessment systems that grade objective questions and identify learning gaps. Generative AI supports teachers by preparing lesson outlines, creating differentiated learning materials for mixed-ability classrooms, generating practice questions, and developing formative assessments aligned with curriculum objectives. When used responsibly and with professional judgement, AI and Generative AI can improve teaching efficiency, enhance student engagement, and support better learning outcomes while allowing teachers to focus more on meaningful classroom interactions.

This version satisfies the Task 1 requirement of defining AI and Generative AI, includes more than two educational applications, and exceeds the minimum 150-word requirement specified in the assignment.

Topic 2 – AI and Education

The integration of Artificial Intelligence in education offers notable benefits while also presenting important risks that educators must anticipate. On the positive side, AI enables more personalised learning experiences by adapting content and pace to individual student needs. For example, adaptive learning platforms can recommend additional practice for students who struggle with mathematics, while AI-powered grading tools reduce teachers' workload by assessing objective questions quickly and accurately. This allows teachers to devote more time to providing meaningful feedback, mentoring students, and designing engaging learning activities.

However, these advantages are accompanied by concerns that require critical attention. AI systems may reflect bias present in their training data, leading to unfair recommendations or reinforcing stereotypes about learners. If an AI system is trained on biased or incomplete

data, it may overlook the needs of certain students or provide inaccurate suggestions. There are also concerns related to data privacy, transparency of algorithms, and equitable access, as students in under-resourced schools may not benefit equally. Therefore, AI should be viewed as a tool that supports teachers rather than replaces them, with educators using their professional judgement to ensure ethical, inclusive, and effective learning experiences.

Reflective Task

Topic 3 – Using Generative AI for an Educational Purpose

Educational Purpose: For this task, I used **Chatgpt** to prepare a short quiz for my Grade VIII English class on reading comprehension. I provided the learning objectives and requested multiple-choice and short-answer questions based on the lesson. The tool generated a variety of questions within a few seconds, which helped me save preparation time and provided useful ideas for designing the assessment. It also suggested questions with different levels of difficulty, making it easier to address the needs of students with varying abilities.

Reflection on Bias, Hallucination or Incorrect information: While reviewing the AI-generated content, I noticed that a few questions were either too general or did not fully match the CBSE learning outcomes. Some examples assumed situations that were not relevant to my students' classroom context. To ensure accuracy,

Verification: I carefully verified every question using the NCERT textbook, CBSE curriculum guidelines, and my own teaching experience before including them in the final assessment. I also modified the wording of several questions to make them more suitable for my students.

Its Importance: This experience showed me that Generative AI is a valuable teaching assistant, but it cannot replace a teacher's professional judgement. AI tools may occasionally produce biased, incomplete, or inaccurate information. Therefore, educators must critically evaluate every AI-generated response before using it in the classroom. Responsible use of AI helps ensure that learning materials remain accurate, fair, relevant, and aligned with educational objectives.
