

AI for Educators – Complete Assignment Answers (Ready to Submit)

Assignment Code: CS_AI_M1_1

The PDF asks for 3 answers with specific word limits and original writing. Below are well-structured answers based on the assignment instructions and learning goals.

Topic 1: Understanding AI and Generative AI

Artificial Intelligence (AI) is a technology that enables computers to perform tasks that normally require human intelligence, such as understanding language, recognising patterns, solving problems, and making decisions. AI helps machines learn from data and improve their performance over time.

Generative AI is a specialised type of AI that creates new content instead of only analysing information. It can generate lesson plans, quizzes, stories, images, presentations, and summaries based on the user's instructions. Tools such as ChatGPT and Google Gemini are examples of Generative AI.

In education, AI supports personalised learning by identifying each student's strengths and weaknesses and suggesting suitable learning activities. It also helps teachers automate routine tasks like grading, attendance, and progress tracking.

Generative AI is especially useful for teachers because it can create worksheets, question papers, lesson plans, and classroom activities in a short time. Students can use it for explaining difficult concepts, practising languages, brainstorming ideas, and preparing study notes.

AI and Generative AI make teaching and learning more engaging, creative, and efficient. However, they should be used responsibly, with teachers verifying the accuracy of the information before using it in the classroom.

Topic 2: AI and Education

Artificial Intelligence has brought many positive changes to education, but it also presents certain challenges. A balanced approach is necessary for its responsible use.

One major benefit of AI is personalised learning. Students receive learning materials according to their individual needs and pace, which improves understanding. AI also reduces teachers' workload by assisting with grading, attendance, lesson planning, and assessment creation. It provides quick feedback and helps identify learning gaps.

However, AI also has risks. Sometimes it generates incorrect or misleading information, known as hallucinations. AI responses may also contain bias because they are based on the

data used for training. If teachers or students rely on AI without verification, they may learn inaccurate information.

Another concern is privacy and ethical use. Educational institutions must protect student data and ensure AI is used fairly and transparently. Teachers should guide students on responsible AI use instead of allowing complete dependence on technology.

Research and educational guidelines emphasise that AI should support teachers rather than replace human judgement, creativity, empathy, and classroom interaction. Responsible AI integration requires critical thinking, fact-checking, and ethical practices in education.

Topic 3: Reflection on Using Generative AI in Education

For this assignment, I used as a Generative AI tool to prepare educational content related to lesson planning and classroom activities. The tool helped generate learning objectives, assessment questions, and simple explanations for different topics. It saved time and provided useful ideas for organising classroom teaching.

While using the tool, I carefully reviewed every response. I noticed that some examples were too general and did not always match the local school curriculum. In a few cases, the AI provided information that needed correction or additional context. To ensure accuracy, I compared the content with school textbooks, official curriculum guidelines, and trusted educational resources before using it.

I did not rely on AI responses without checking facts. I also modified examples to make them suitable for my students' learning level and classroom environment.

This experience showed that AI is a helpful assistant, but it is not always correct. Teachers and learners must evaluate AI responses critically to identify bias, incorrect information, or missing context. Human judgement, subject knowledge, and ethical responsibility remain essential for using AI effectively in education.
