

Assignment Answer Sheet: Artificial Intelligence in Education

Section 1: Defining AI and Generative AI

1.1. Artificial Intelligence (AI)

Artificial Intelligence (AI) is a technology that enables computers and machines to think, learn, understand and perform tasks that normally require human intelligence. AI can help teachers save time, analyse information, answer questions and support student learning.

Example: An AI tool can help a teacher create a lesson plan, check students' answers or suggest activities according to their learning needs.

1.2. Generative Artificial Intelligence (Generative AI)

Generative AI is a type of AI that can create new content based on instructions given by a user. It can generate text, pictures, PowerPoint presentations, stories, questions and worksheets.

Example: A teacher can ask a Generative AI tool to create a kindergarten story, worksheet, poem or classroom activity on a particular topic.

Section 2: AI and Education – Implications and Analysis

Artificial Intelligence (AI) is becoming a useful support tool in education. It can help teachers save time, understand students' needs, prepare learning materials and make classroom activities more engaging and interesting.

2.1. Benefits of AI in Education

a. Saving teachers' time – AI can help teachers prepare lesson plans, worksheets, quizzes, stories and classroom activities efficiently.

Example: A kindergarten teacher can ask AI to create a worksheet on “Healthy Habits” with simple pictures.

b. Student-focused learning – AI can help teachers suggest activities according to a child's learning level and needs.

Example: If a child is struggling with letter recognition, AI can suggest simple letter-matching games and practice activities.

c. Making learning interesting – Teachers can use AI to create stories, poems, games, images and interactive activities.

Example: A teacher can create a short story about sharing and kindness for Jr. KG children.

2.2. Implications of AI in Education

- Teachers can become facilitators and guides rather than relying only on traditional teaching methods.
- AI gives teachers new ideas for activities, stories, projects and teaching methods.
- Teachers need to learn how to use AI tools effectively and responsibly.

- AI-generated information may sometimes be incorrect, so teachers should check the content before using it.
- Teachers should avoid entering students' personal or confidential information into AI tools.
- Young children need encouragement, care, communication and emotional support that technology cannot replace.

2.3. Simple Analysis for Teachers

AI can be a helpful teaching assistant, but it should not become the teacher. A teacher understands children's emotions, behaviour, abilities and classroom environment.

Section 3: Understanding AI and Generative AI – Personal Reflection

As a teacher, I understand AI as a technology that helps computers perform tasks that normally require human thinking. Generative AI is a type of AI that can create new content such as stories, worksheets, poems, pictures and lesson ideas.

I feel that AI can be a helpful teaching assistant. For example, while teaching kindergarten children, I can use AI to get ideas for fun classroom activities, simple stories, poems, worksheets and learning games. If I am teaching the topic “Healthy Habits”, I can create a simple story or activity with the help of Generative AI to help children understand the topic easily.

I have also understood that AI should be used carefully and responsibly. Teachers should not depend completely on AI.

My personal reflection is that AI can make teaching easier and more creative, but it cannot replace a teacher. A teacher provides love, care, understanding and personal attention to children.
